

OIL & GAS

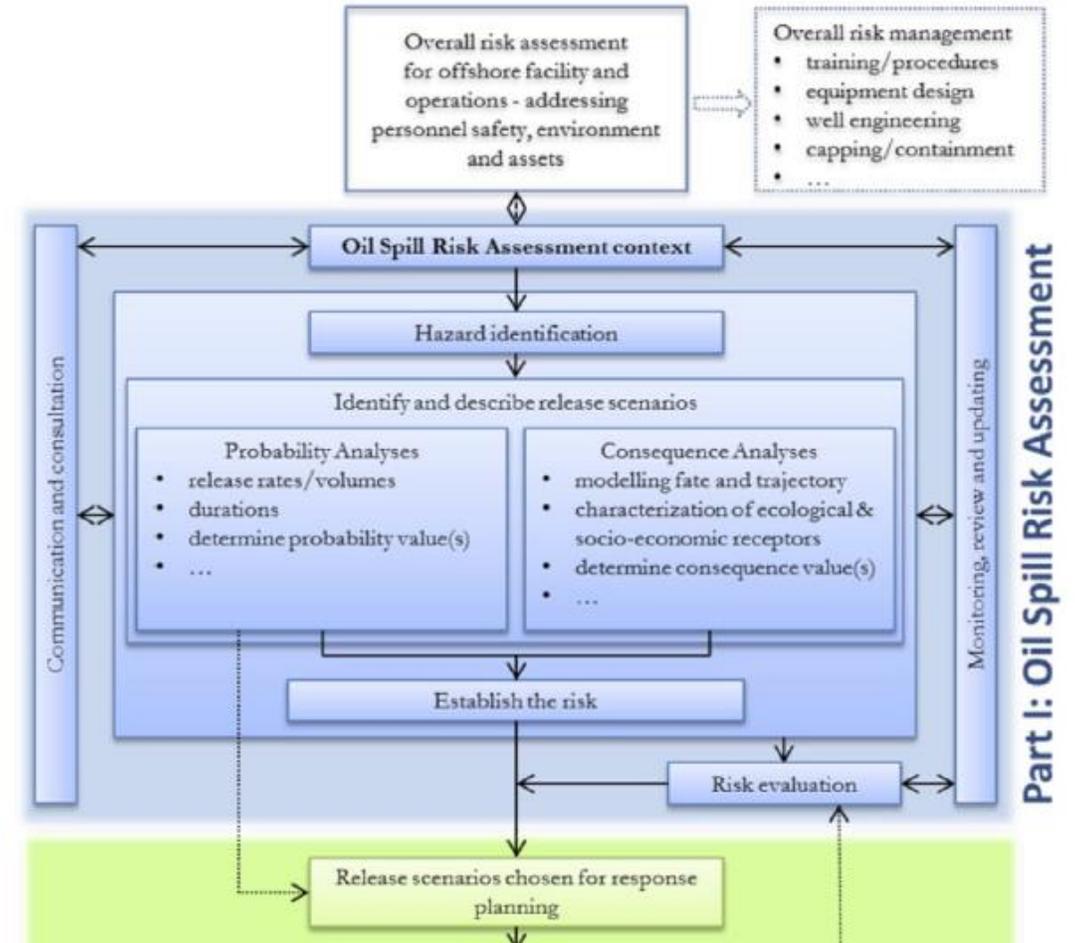

Miljørisikoanalyser som styringsverktøy

Odd Willy Brude

2. mai 2018

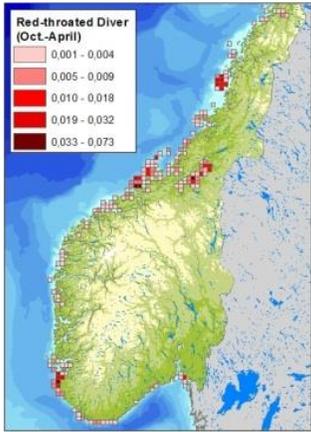

Miljørisikoanalyser som styringsverktøy

- Litt om analyser og bruk
 - Utfallsrom / variasjon
 - Risikobasert tenkning
- Problemstillinger fra Barentshavet
 - Svømmetrek / Polarfront / Iskant
 - Risikokommunikasjon / formidling
 - Dynamisk tilnærming
 - ismåke / MARAMBS / isbjørn
- ERA Acute - ny miljørisikometodikk
 - Metode / software
 - NEBA / SIMA

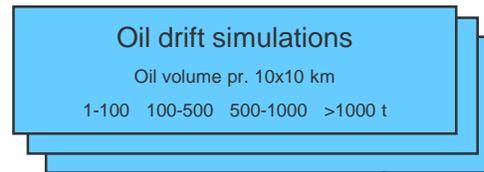

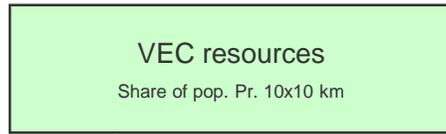

Oil spill risk assessment and response planning for offshore installations (IOPG / IPIECA 2014)

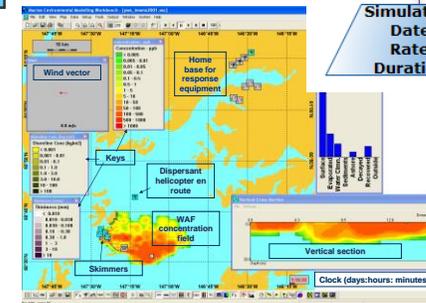

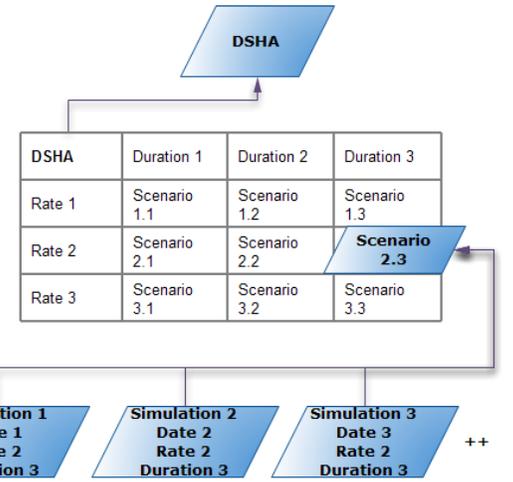

Miljørisikoanalyser - MIRA

VEC - Valued ecosystem components

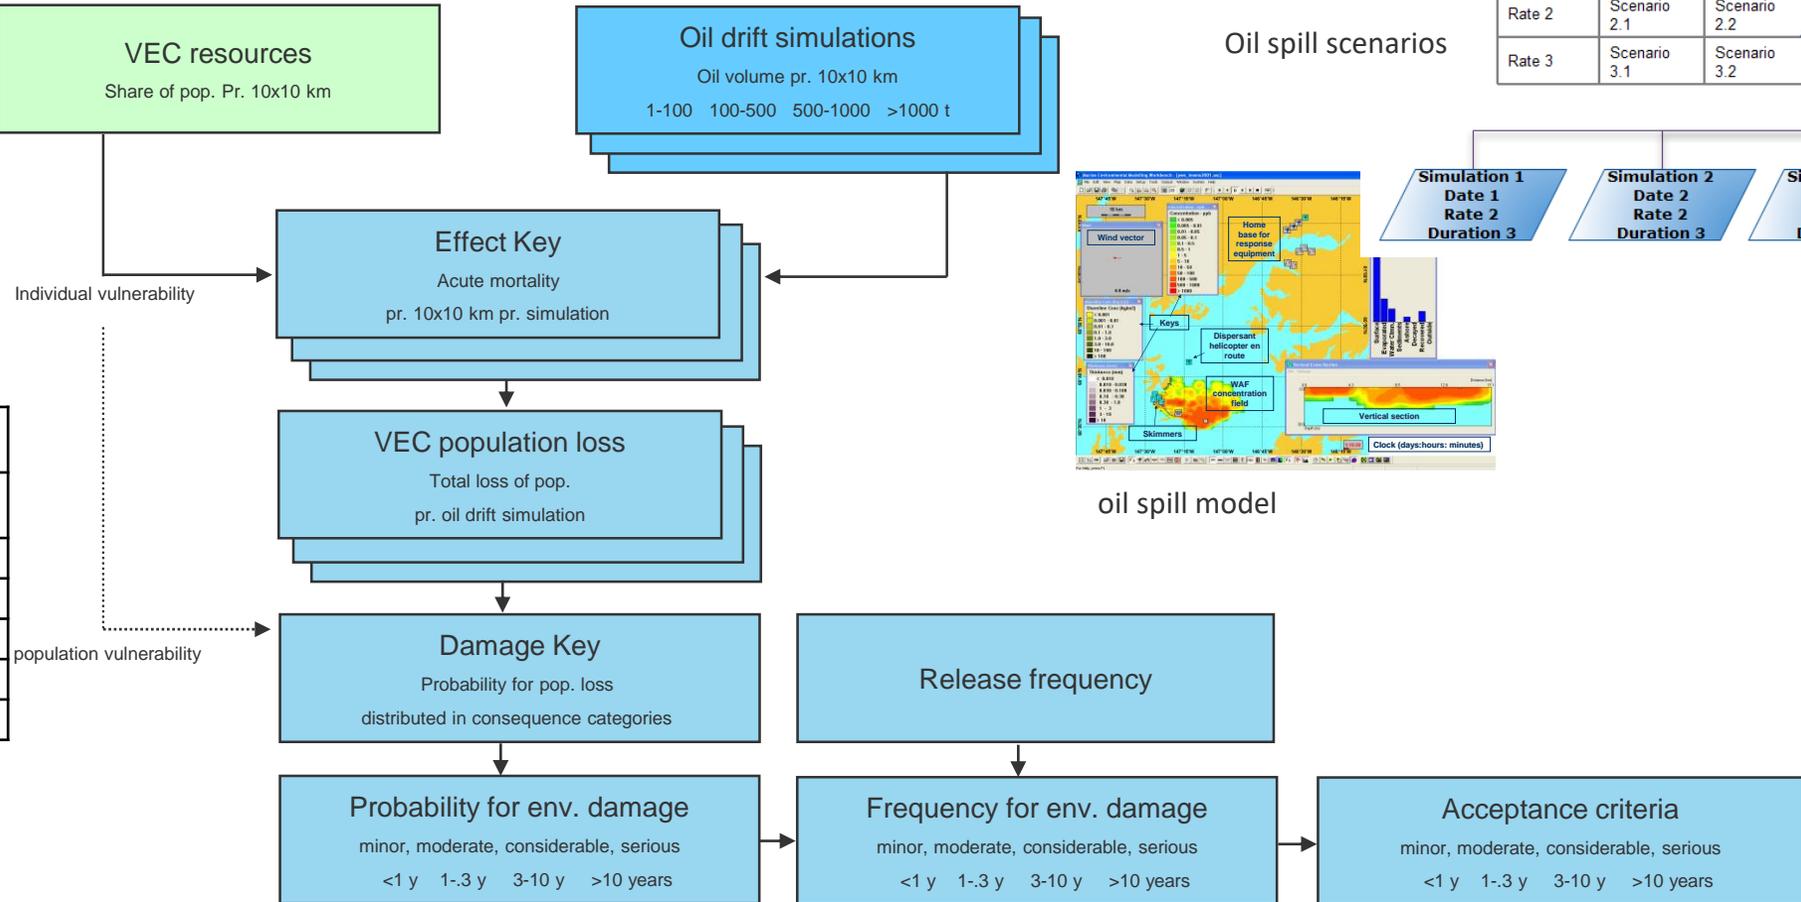

Oil spill scenarios

oil spill model

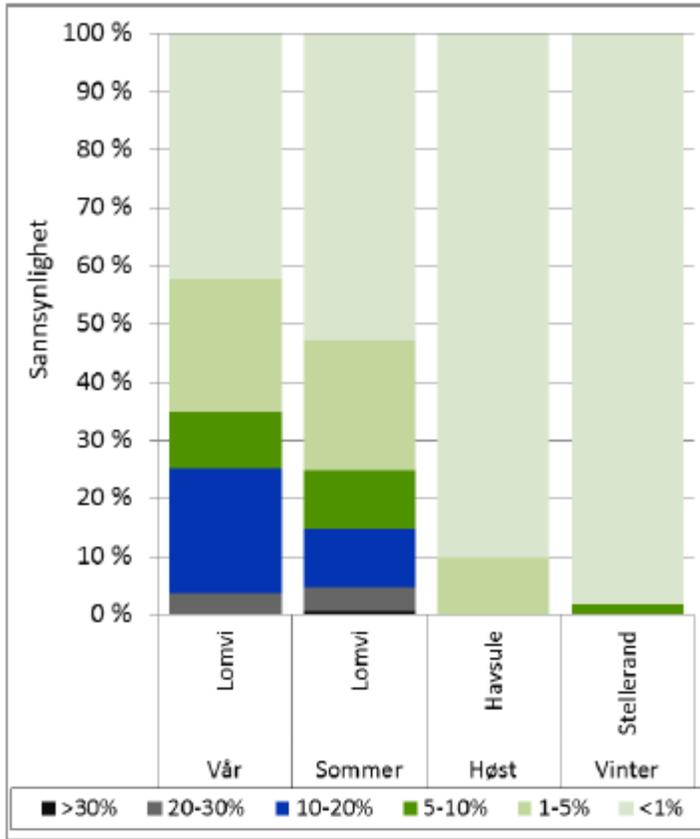

Effect key

| Oil mass (tons) in 10 x 10 km grid cell | Effect key – acute mortality rate | | |
|---|--|----------------|----------------|
| | Individual vulnerability for VEC seabird | | |
| | S ₁ | S ₂ | S ₃ |
| 1-100 | 5 % | 10 % | 20 % |
| 100-500 | 10 % | 20 % | 40 % |
| 500-1000 | 20 % | 40 % | 60 % |
| ≥1000 | 40 % | 60 % | 80 % |

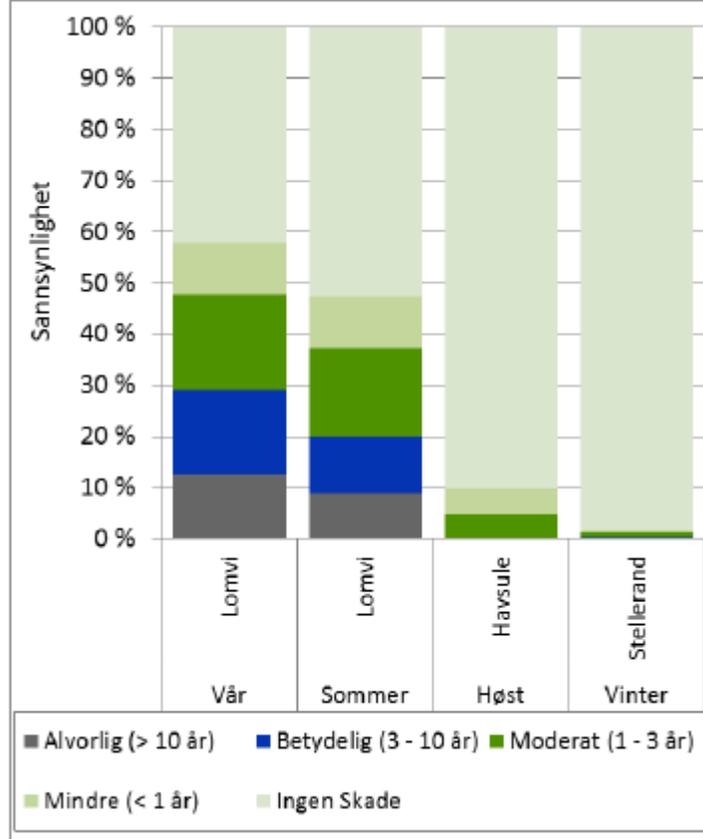

Konsekvenspotensial

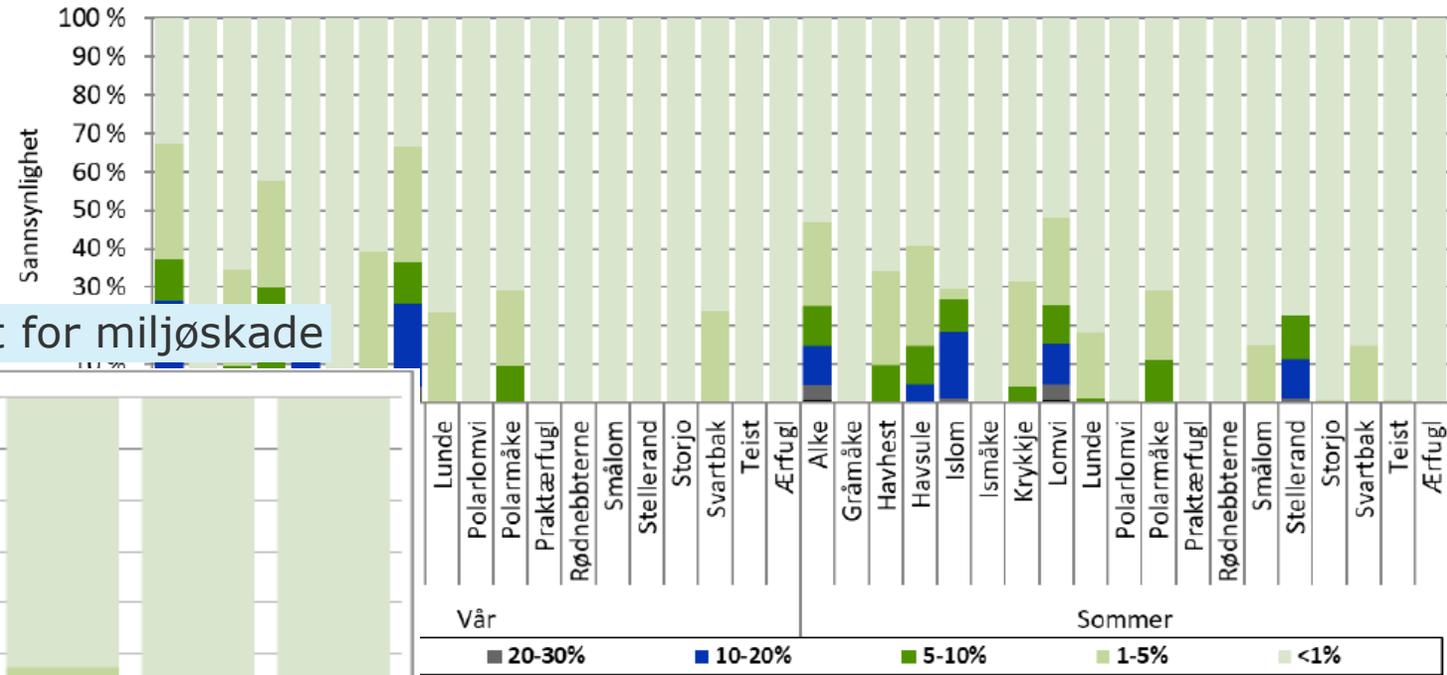

Sannsynlighet for bestandstap

Sannsynlighet for miljøskade

Sesongvariasjon i miljøkonsekvens og -risiko

DEA Norge AS søker om boring av brønn Gråspett (2018/4635)

Miljødirektoratet har mottatt søknad fra DEA Norge AS om tillatelse til boring av letebrønn 7321/4-1 Gråspett i PL721 i Barentshavet.

24.04.2018

Olje og gass

Brønn 7321/4-1 Gråspett er lokalisert 309 km fra norskekysten. Avstand til Bjørnøya er 93 km.

Boring av brønnen er planlagt med tidligst oppstart 25. august 2018. Boringen er planlagt gjennomført med den halvt nedsenkbare riggen Island Innovator. Estimert varighet er 37 døgn.

DEA Norge AS vurderer at miljørisiko for brønnen er akseptabel og at de foreslåtte beredskapstiltak er tilstrekkelige ut fra en vektet rate på 1120 Sm³/ for overflateutblåsning. DEA planlegger med 3 NOFO-systemer på åpent hav. Høyeste miljørisiko er beregnet for pelagisk sjøfugl i vårsesongen, med høyest utslag for lomvi og havhest. Det er også beregnet høy risiko for kystnær sjøfugl på Bjørnøya. DEA planlegger for borestart etter 25. august 2018 for å redusere miljørisiko for sjøfugl.

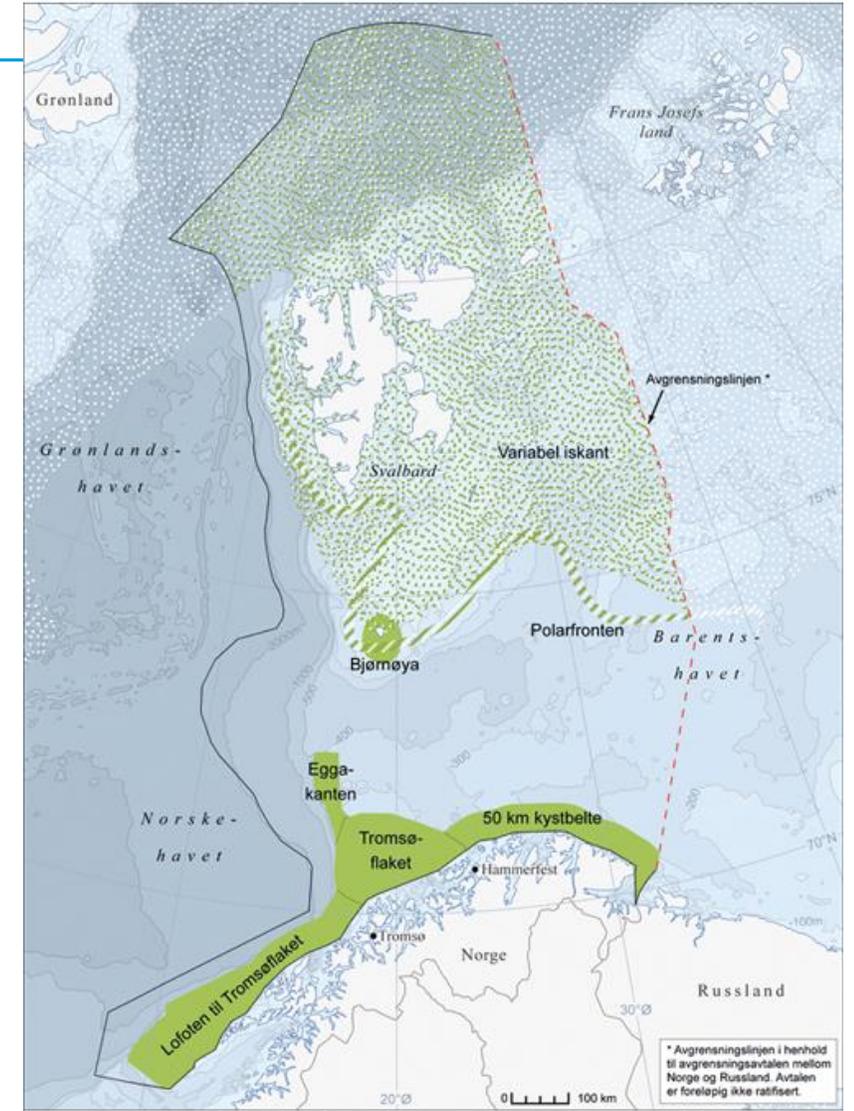

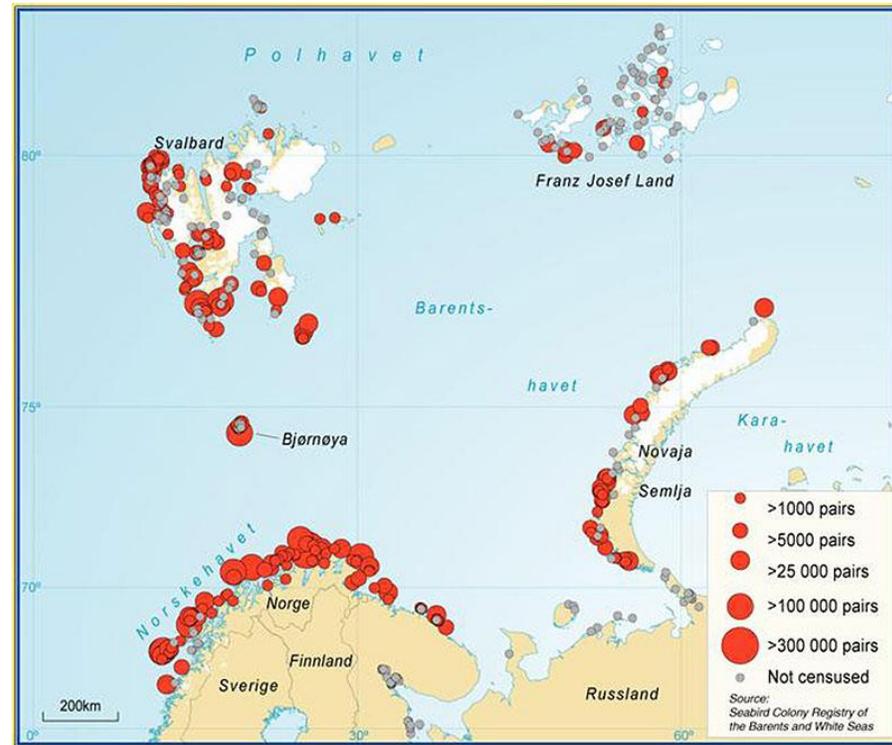

Tilnærming til dynamiske VØK'er / SVO'er

Eksempler fra Barentshavet

Særlig verdifulle og sårbare områder

- Høy miljøverdi i de særlig verdifulle og sårbare områdene er blitt ytterligere bekreftet og styrket.
 - Lofoten til Tromsøflaket
 - Eggakanten
 - Iskantsonen
 - Polarfronten
 - Bjørnøya
 - Kystbeltet

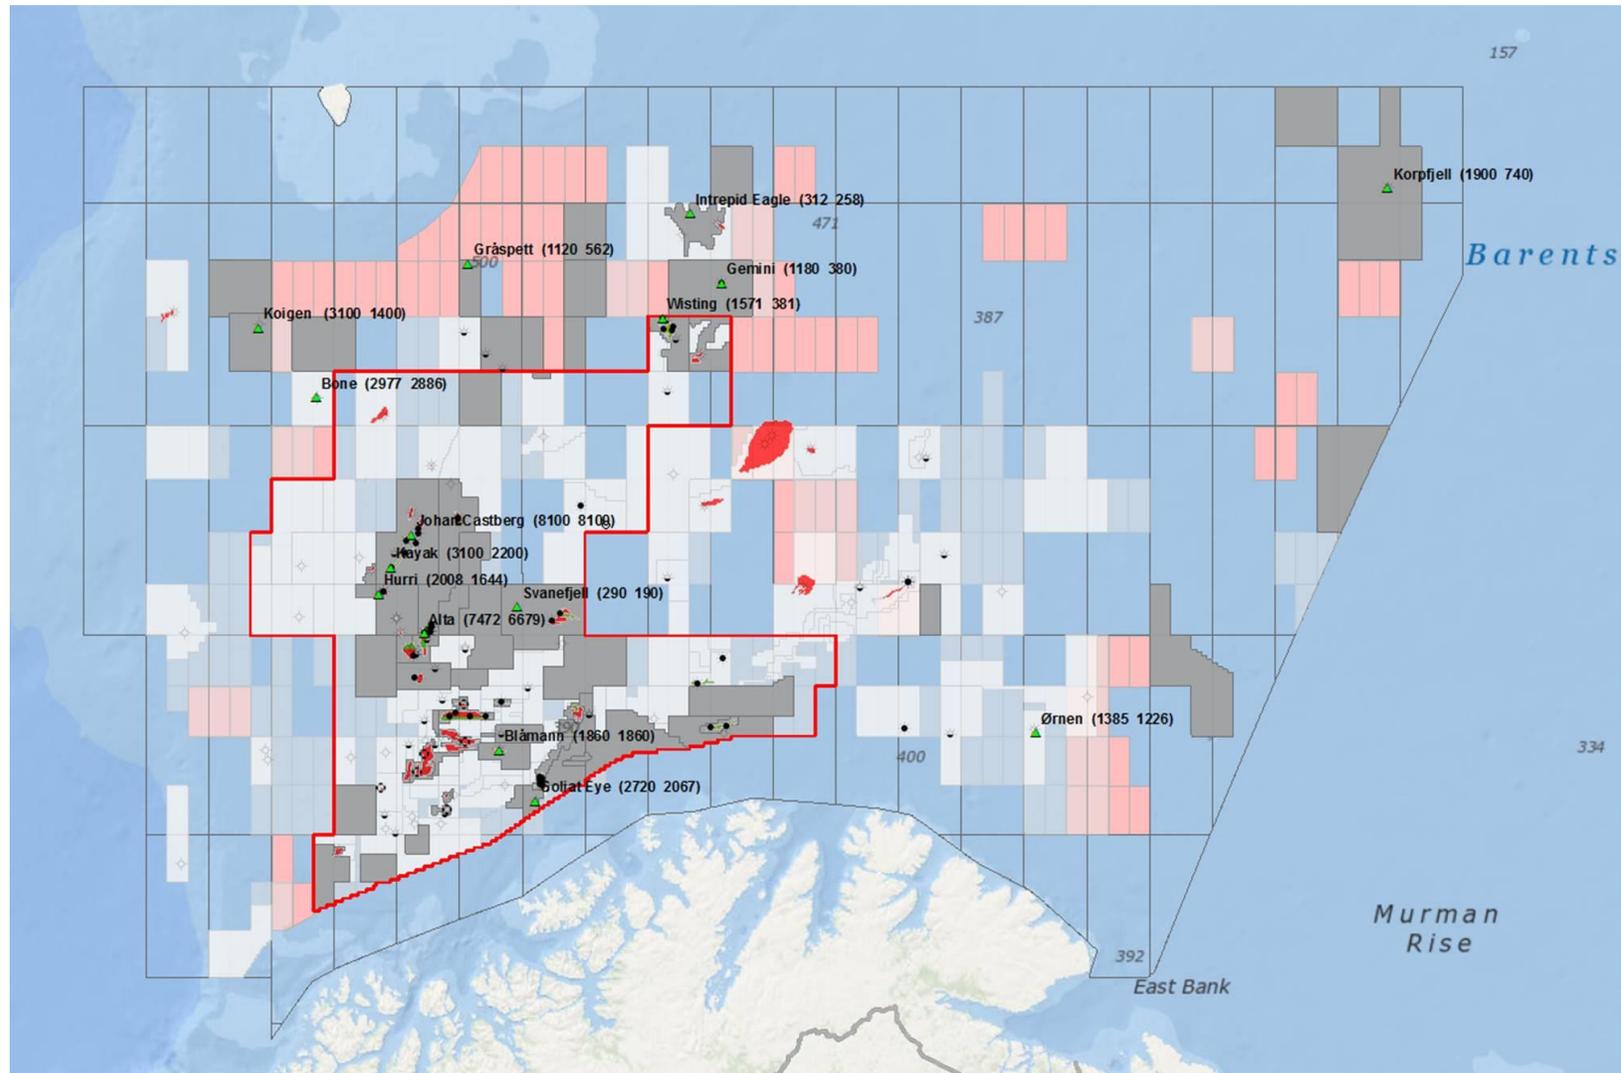

Kartografi: Norsk Polarinstitutt 2011. Kilde: IBCAO

Miljørisiko akutt utslipp

- Utredet i forvaltningsplaner og åpningsprosessene
- Nivå på linje med de andre havområder på norsk sokkel
- Miljørisiko avhenger av mange forhold:
 - sannsynligheten for utslipp
 - type utslipp, størrelse og varighet på utslippet, utslippslokasjon (overflate/sjøbunn)
 - dets geografiske posisjon i forhold til sårbare områder og ressurser og rådende vær/strømforhold (drivbane)
 - tidspunkt i forhold til perioder på året når sårbarheten for akutte utslipp er særlig stor
- I tillegg vil effektiviteten av ulykkesforebygging og beredskap mot akutt forurensning være viktige faktorer.

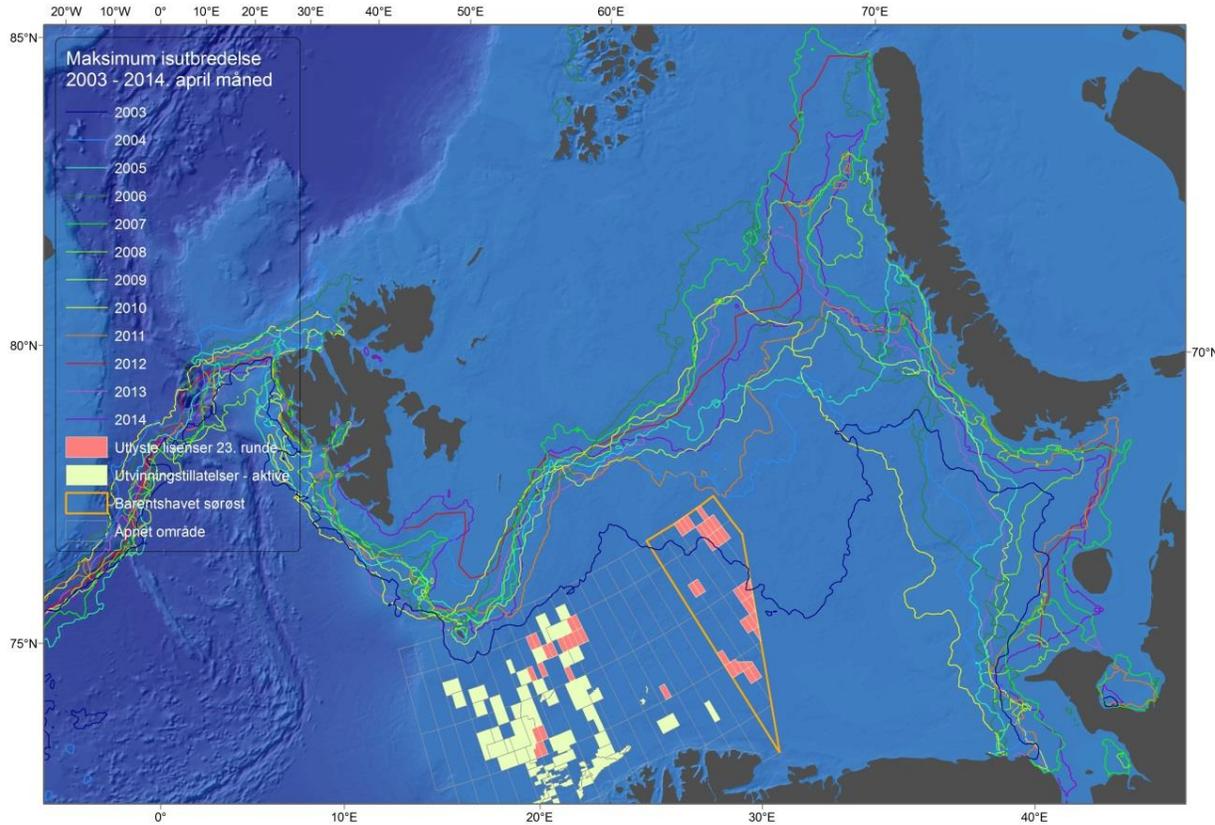

Aktivitet i Barentshavet

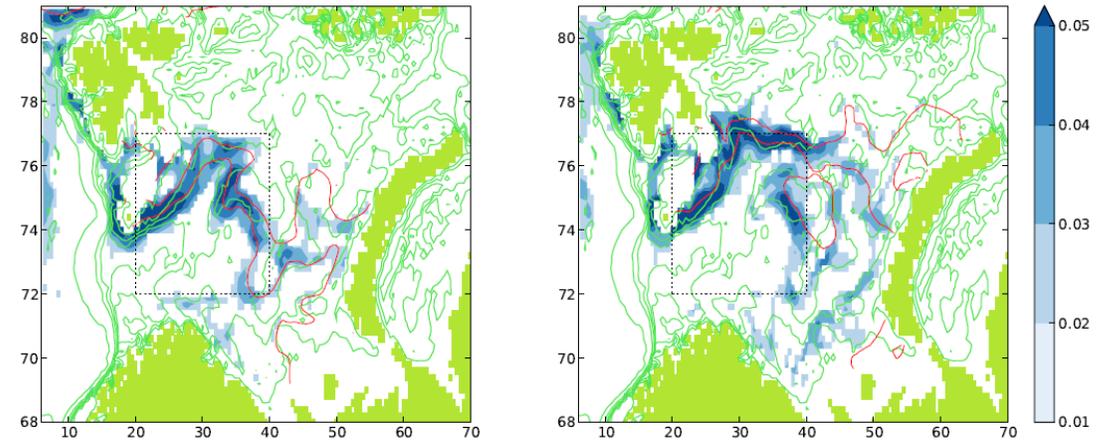

Stor variasjon / mye dynamikk

Iskant

Polarfront

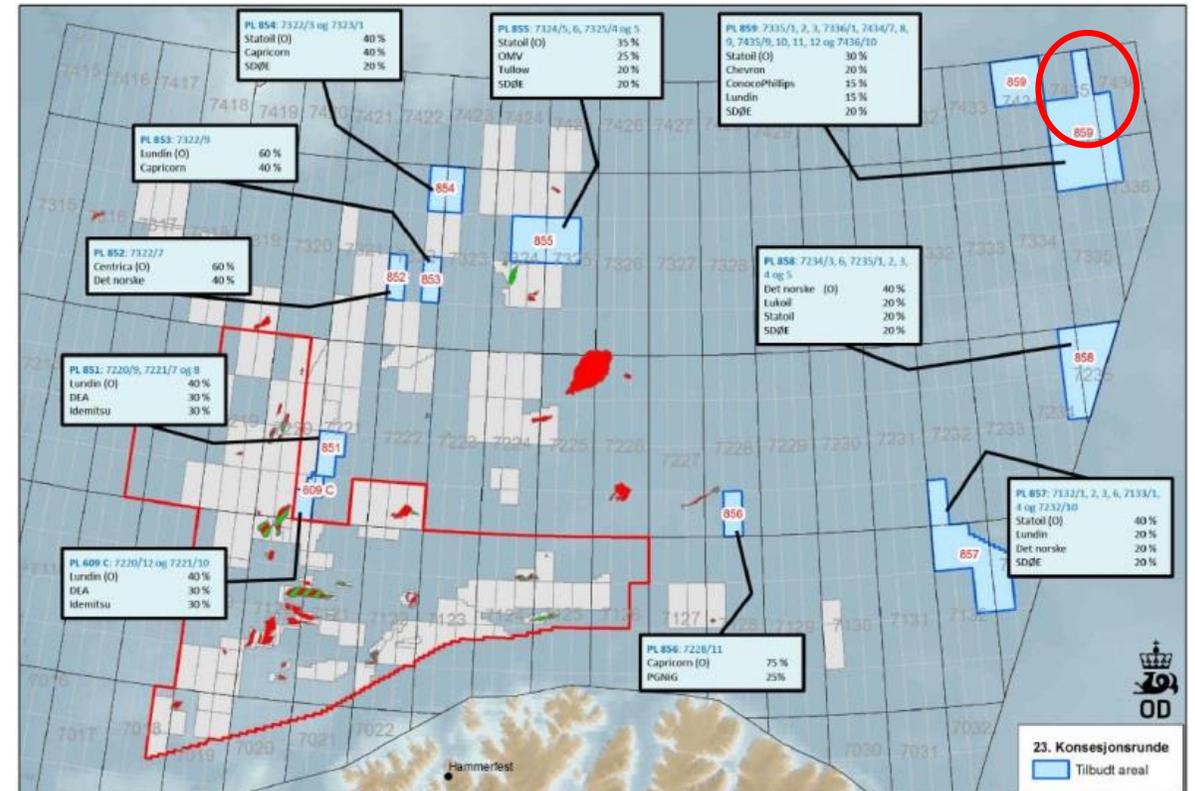

Figur 2.2: Observert middelfrontposisjon i de sju kalde og varme år. De røde konturene er 0 og 2 graders isotermer

Ådlandsvik (2009). Vannmasser og polarfront i Barentshavet
<http://noracia.npolar.no/litteratur/vannmasser-og-polarfront-i-barentshavet.pdf>

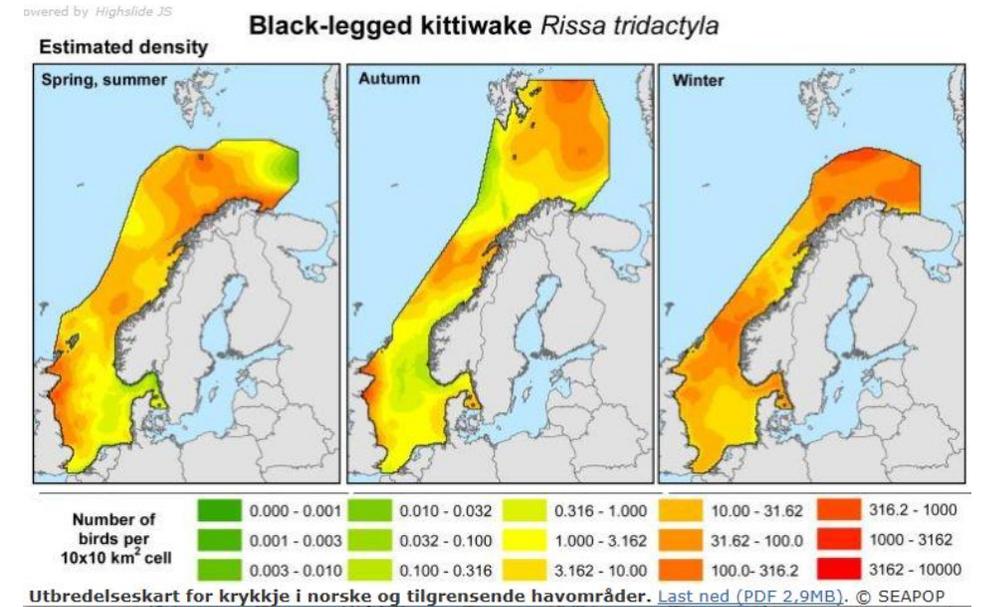

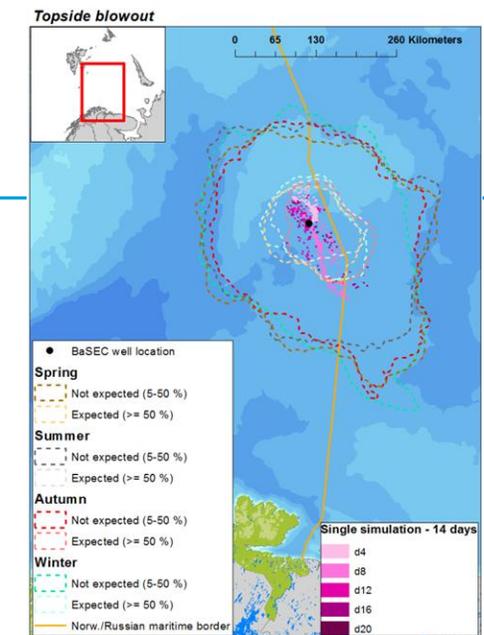

Miljørisikoanalyse for Blokk 7435/9

- BaSEC studie 2015/16
- Utblåsningsrater fra 400 til 5000 m³/døgn og utblåsningsvarigheter fra 2 til 84 døgn
- Miljørisikoanalyse
- Modellbasert oljevernberedskapsanalyse

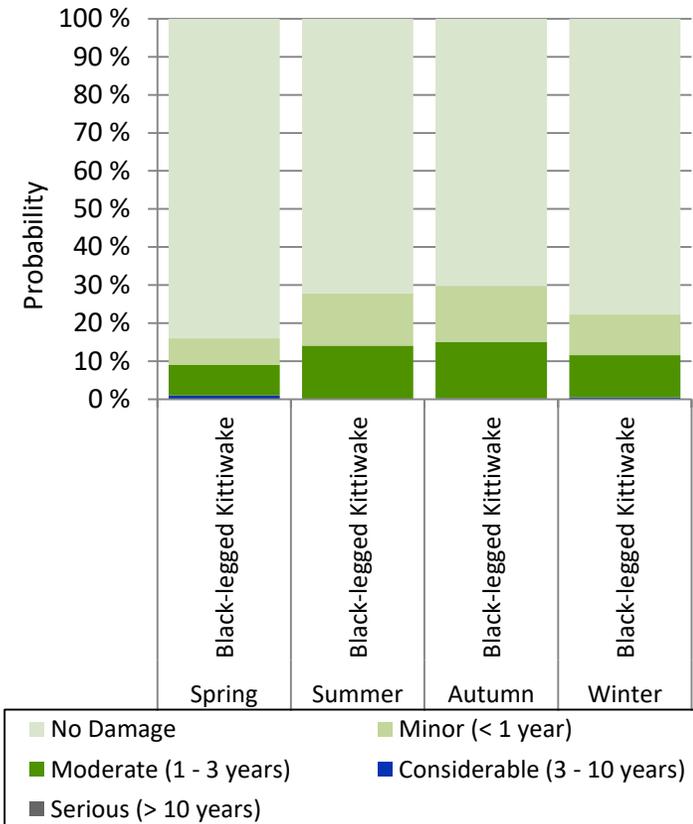

Miljørisikoanalyse for Blokk 7435/9

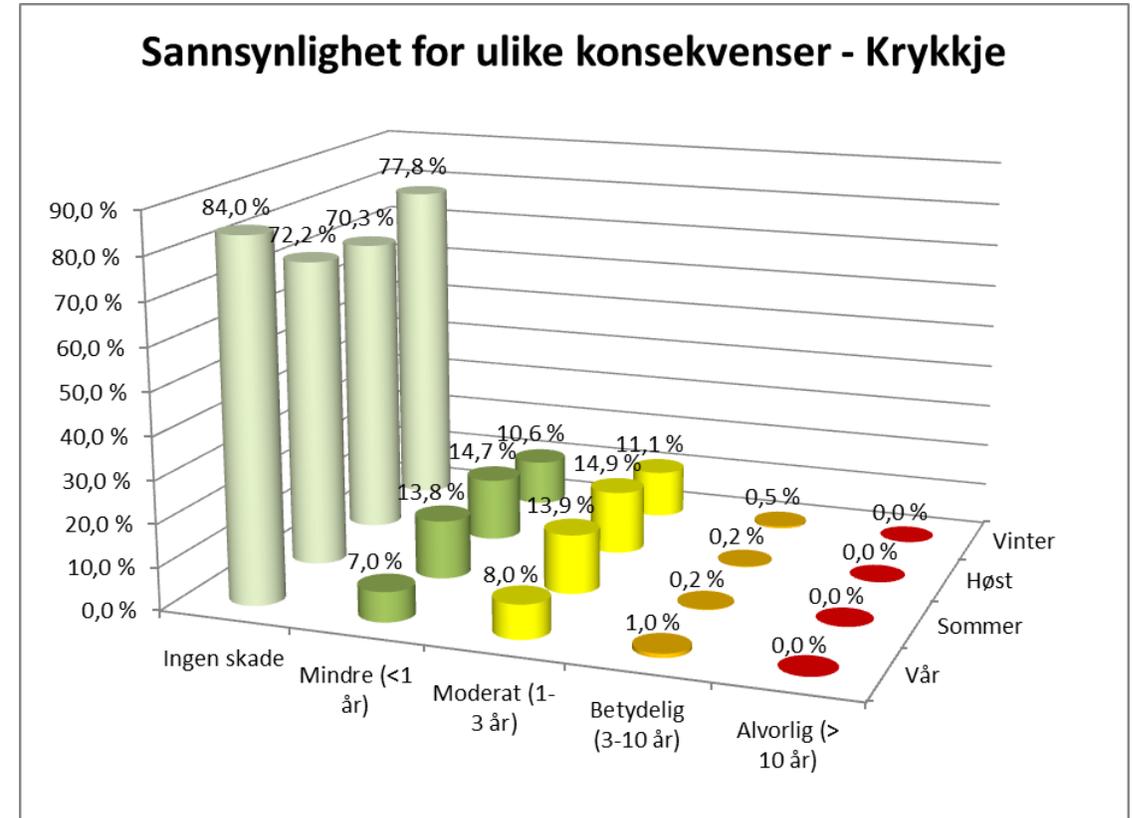

- Ingen stranding av olje
- Begrenset effektområdet i vannsøylen (<40 km fra utslippspunktet) som kan gi effekter og dødelighet på fiskeegg og -larver.
- Sjøfugl mest berørt ved en utblåsning (krykkje, lunde, polarlomvi)
- Spørsmål vedr. datagrunnlag og dynamikk
 - SEAPOP / SEATRACK
 - Is og iskant / polarfront

Sannsynlighet for ulike bestandstap

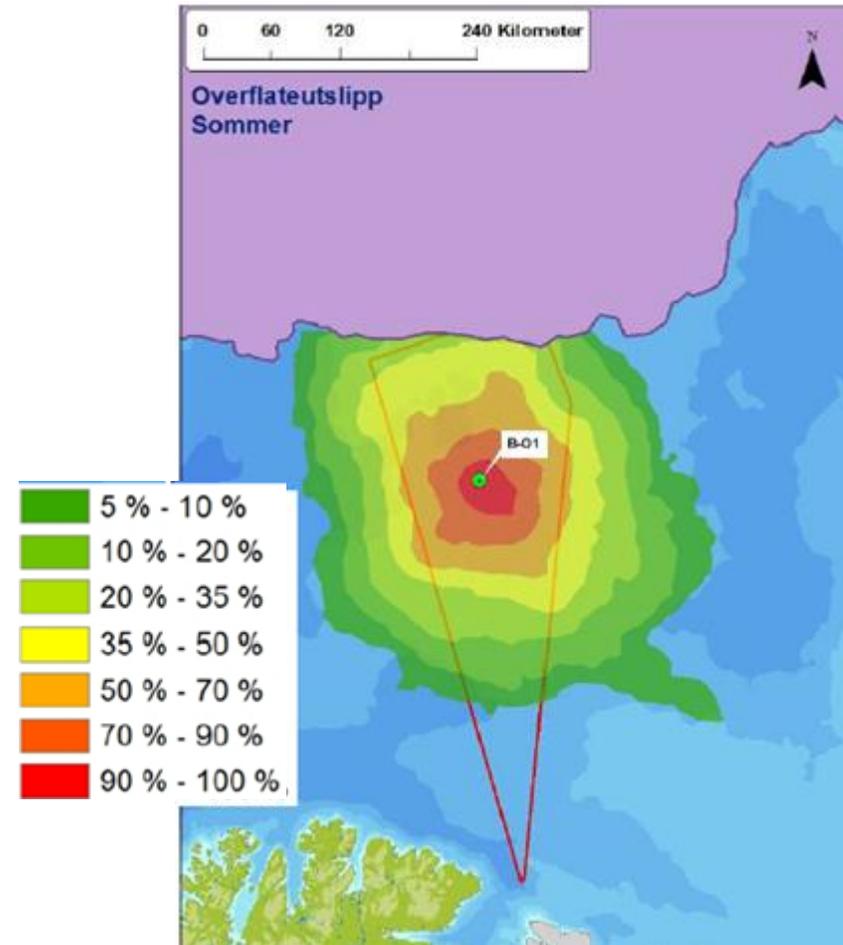

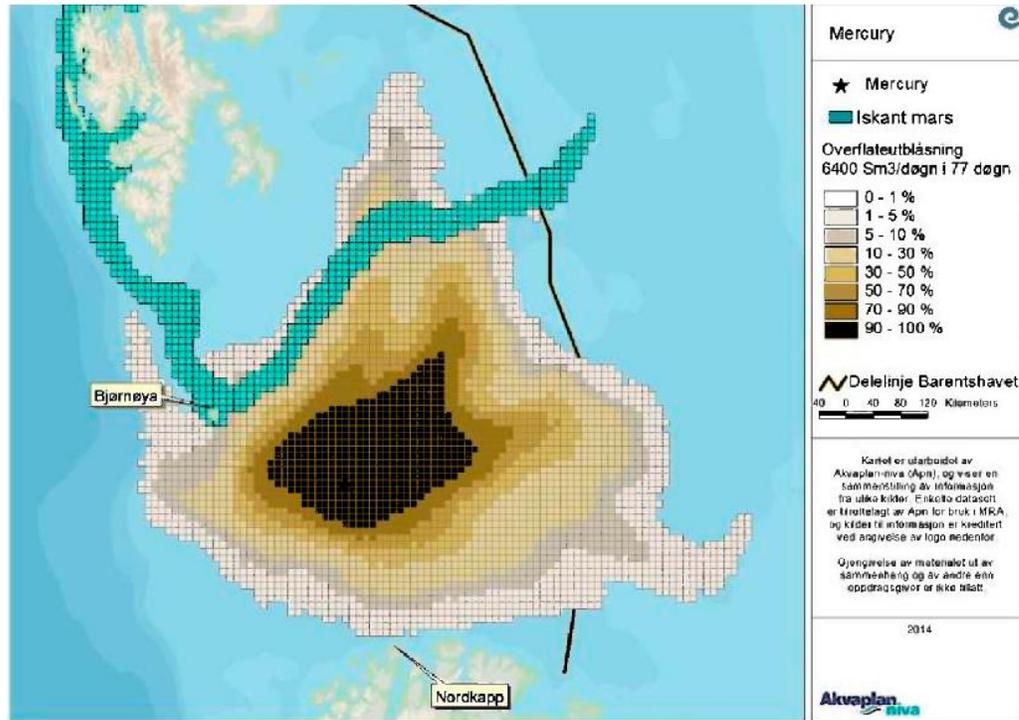

VS

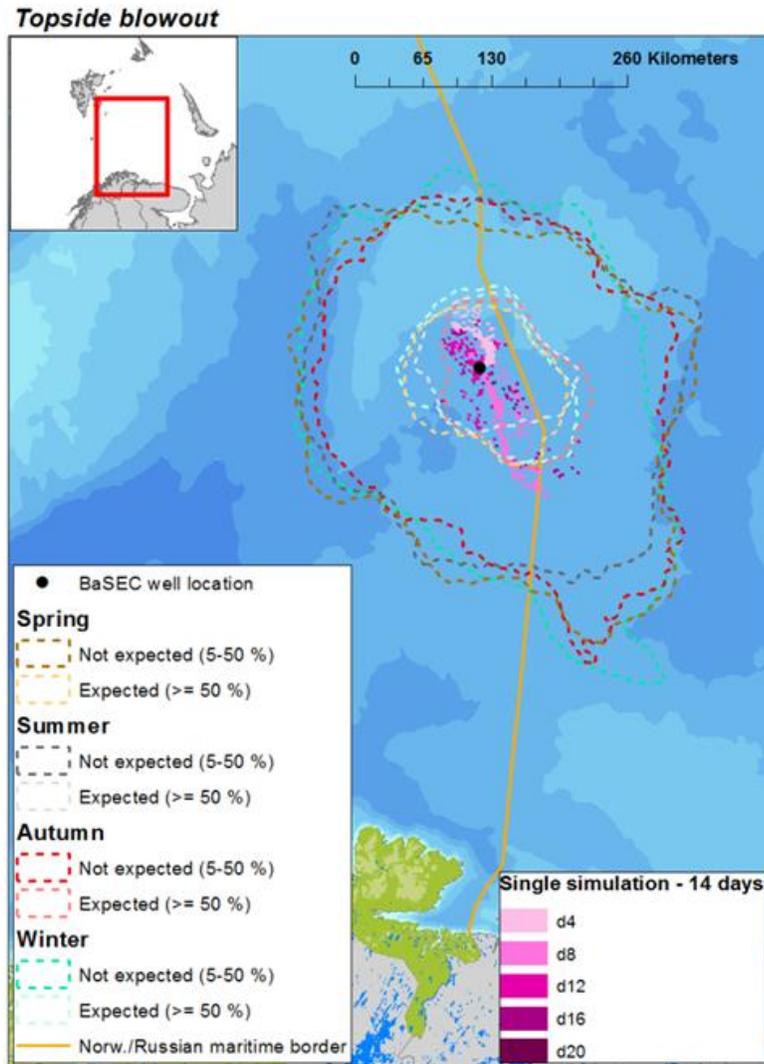

Risikokommunikasjon rundt iskant

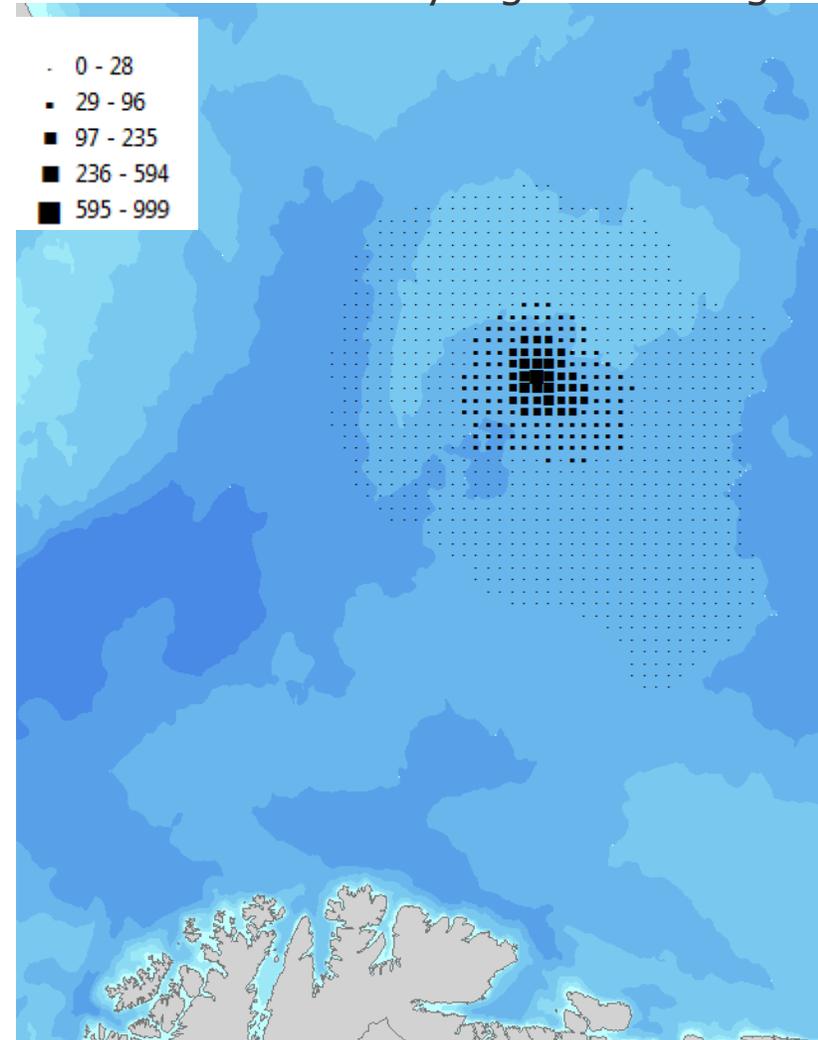

- Eksempler fra tidligere analyser

Resultater av oljedriftsmodellering

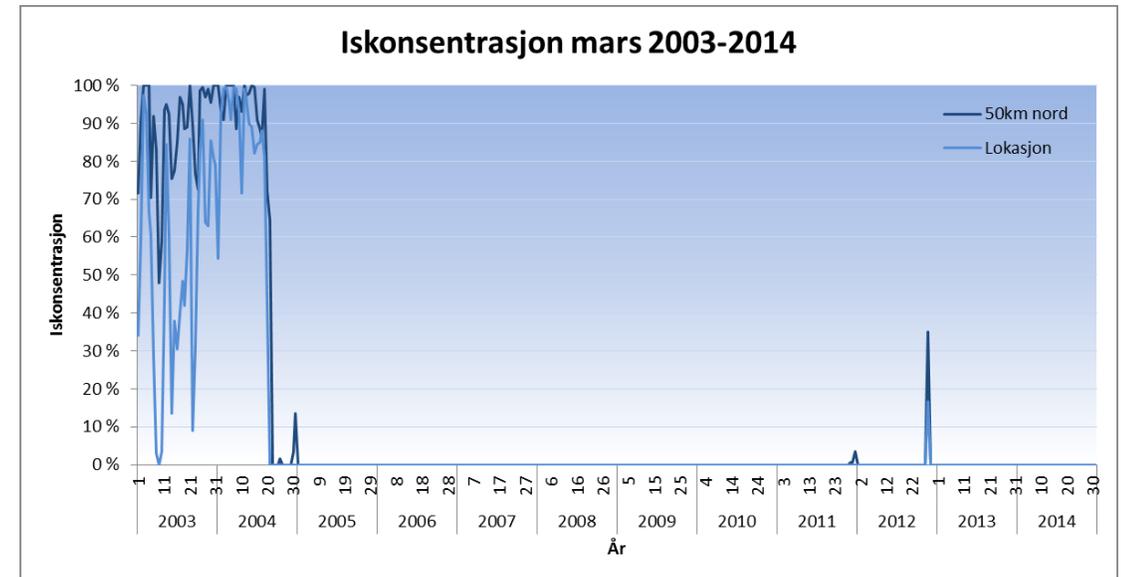

Sannsynlighet * mengde

Miljørisikoanalyse for Blokk 7435/9

- Oljedriftsmodellering med iskonsentrasjoner
- De siste 12 årene har det vært 12 % sannsynlighet for mer enn 15 % iskonsentrasjon på lokasjonen i perioden januar – april
- Oljedriftsberegningene som er utført for blokk 7435/9 viser at det er svært lite sannsynlig at olje driver inn til en iskant som er mer enn 50-100 km unna.
 - Samvariasjon i isdrift / oljedrift

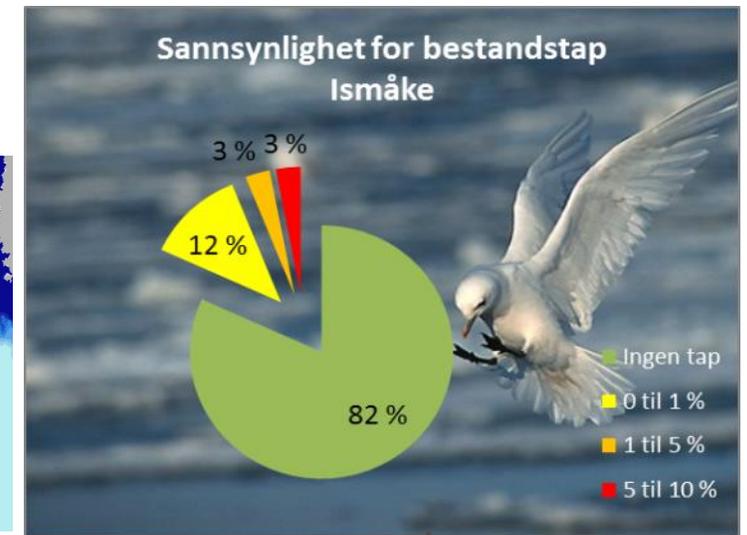

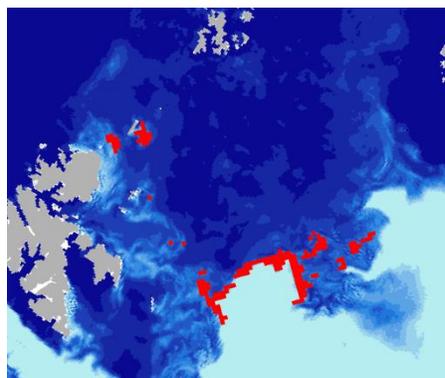

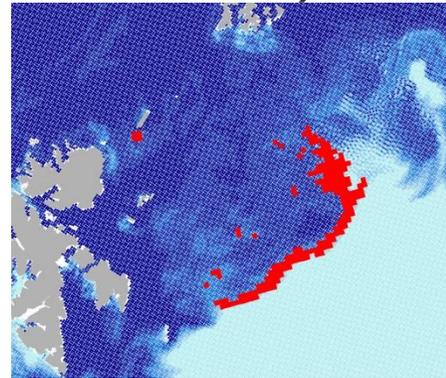

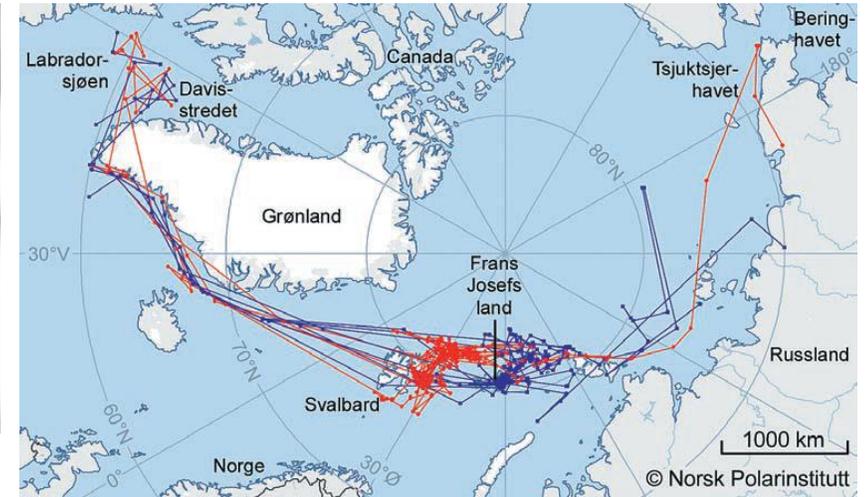

Sammenheng isdrift - oljedrift

Miljørisikoanalyse for Blokk 7435/9

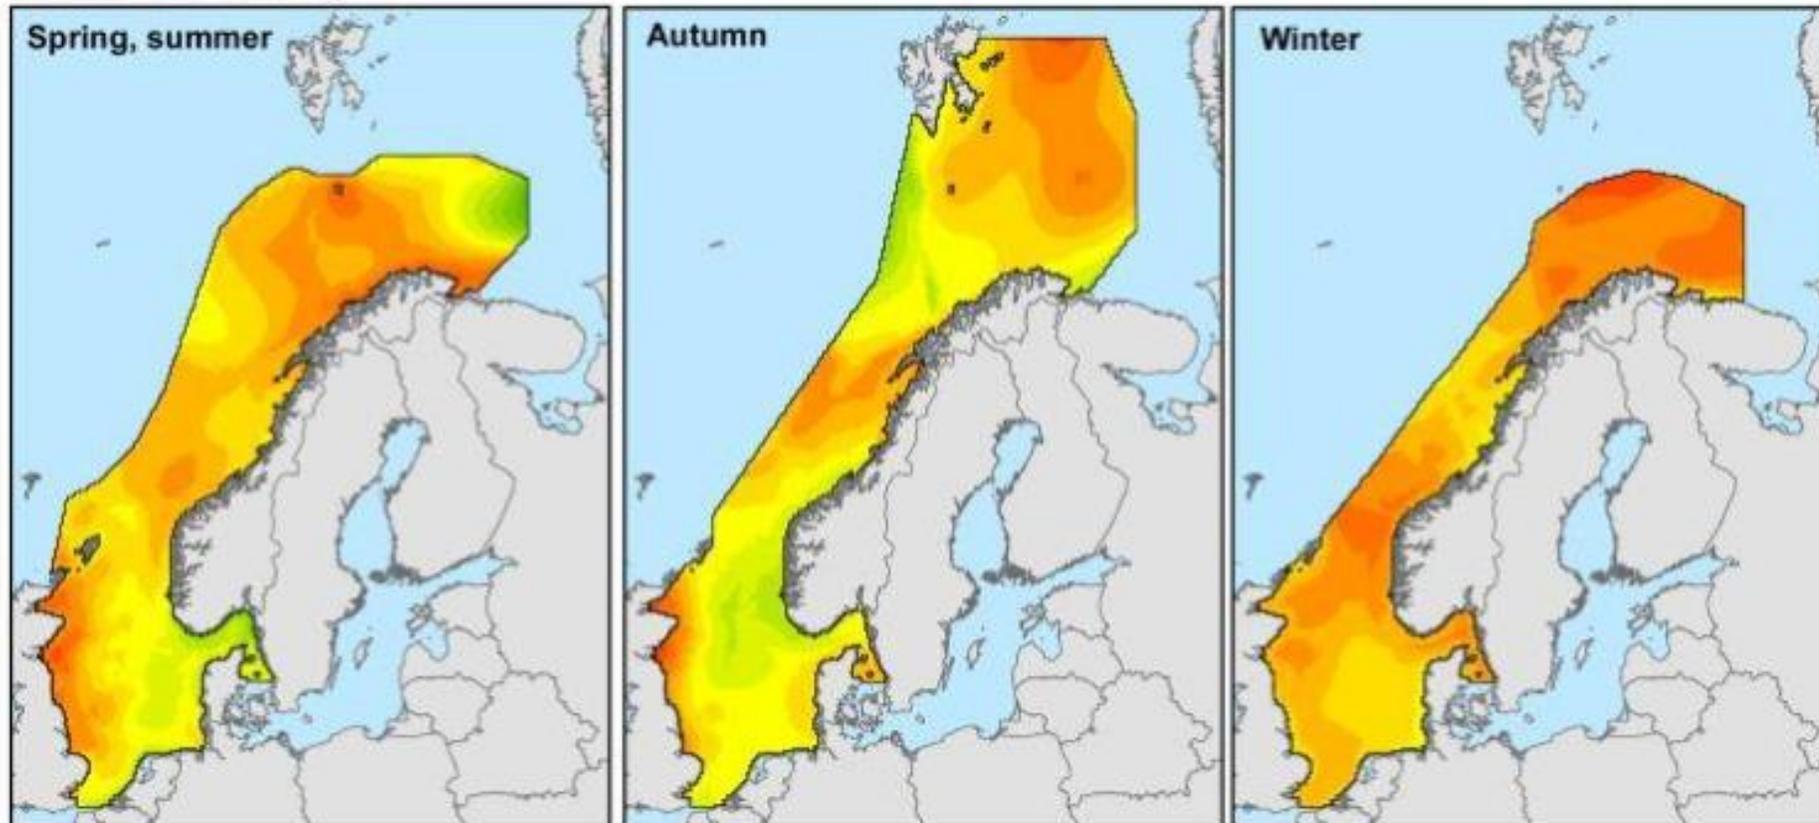

- Miljørisiko i iskantsonen
- Tilrettelagt dynamiske data for ismåke
 - 20-50 % iskonsentrasjon
 - Månedlige datasett (eks feb 2004)
- Miljørisikonivå
 - Sannsynlighet for utblåsning 1.41×10^{-4} per leteboring (en utblåsning for hver 7092 letebrønn)

ABM vs SEAPOP

RISK

| Acute population loss | Environmental damage Recovery time (years) | | | |
|-----------------------|---|----------------------|--------------------|---------------------|
| | Minor (<1 y) | Moderate 1-3 yrs. | Cons. 3-10 yrs. | Serious >10 yrs. |
| 1-5 % | 50 % | 50 % | | |
| 5-10 % | 25 % | 50 % | 25 % | |
| 10-20 % | | 25 % | 50 % | 25 % |
| 20-30 % | | | 50 % | 50 % |
| ≥ 30 % | | | | 100 % |

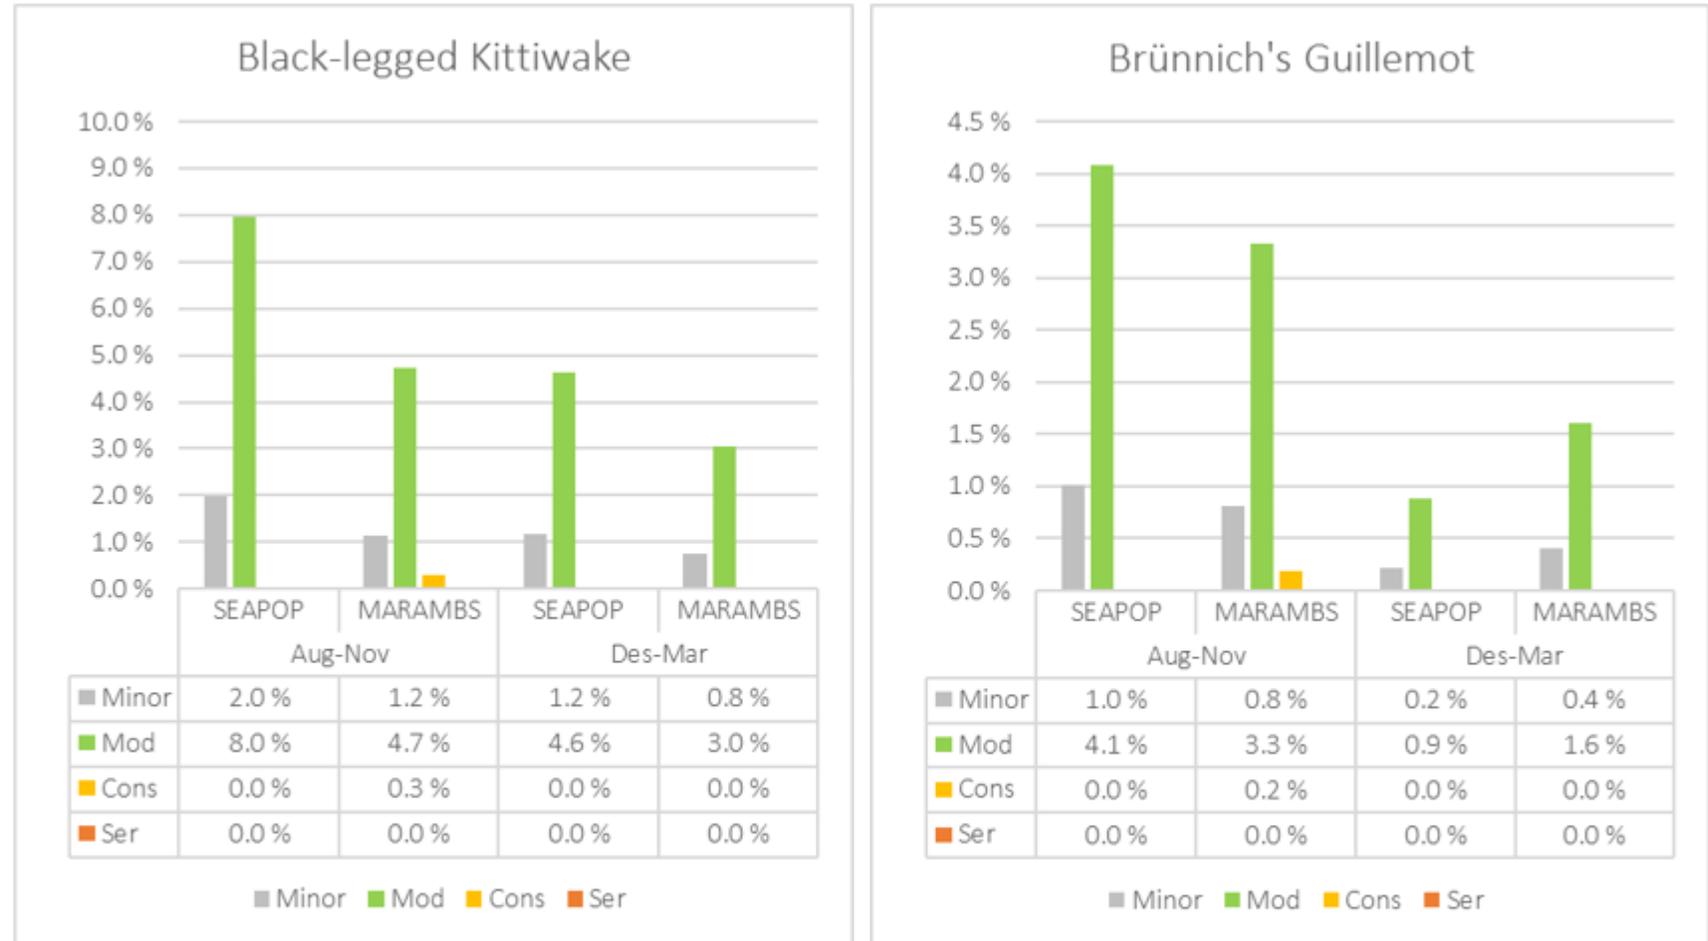

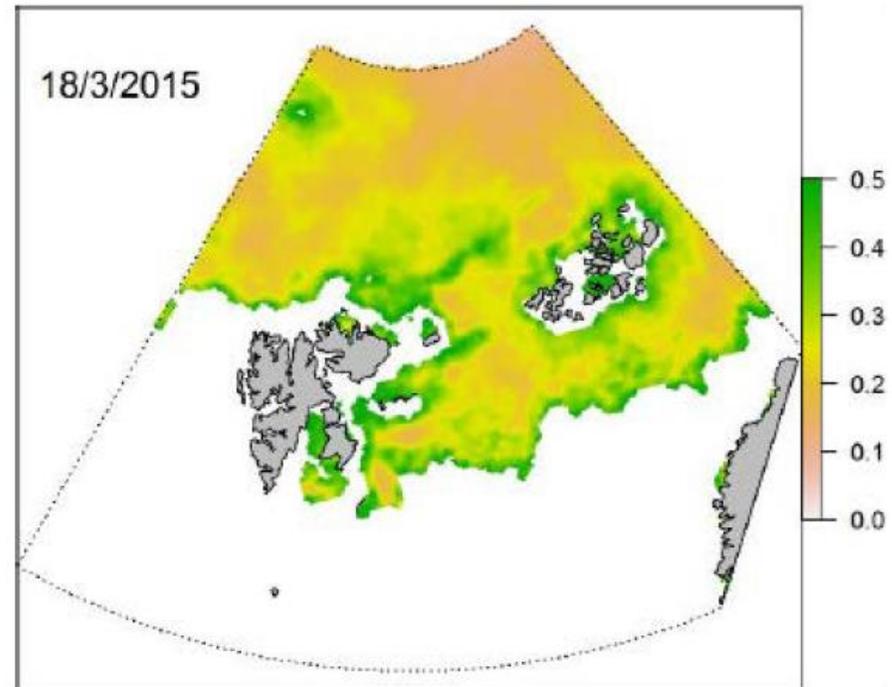

Figure 8 Risk for environmental damage for SEAPOP data and MARAMBS daily distribution data for autumn and winter period. Data is weighted for the three blowout durations and is shown as part of the operational acceptance criteria.

Isbjørn

- Norsk Polarinstitutt har modellert isbjørn habitat bruk med RSF (Resource Selection Function) basert på satellitt-telemetri data fra 226 binner fra 1990-2015 (NPI og Statoil, 2016)
- Isbjørn har en habitat preferanse for områder med 15-75 % iskonsentrasjon
- RFS gir grunnlag for å predikere daglig historisk utbredelse basert på 12.5 km iskonsentrasjonskart når de skaleres til konsentrasjonskart /tetthetskart. Dette er utført i utvalgte år i perioden 2003 – 2011.

Figur 34 Eksempel på predikert isbjørntetthet (antall/100 km²) 15 mars 2015. Kilde (Norsk Polarinstitutt 2016)
